

# Pride & Joy

*An investigation of mental health correlates in LGBTQ+ people*

Emily K. Sanders  
June 2024

# Problem Statement

- ▶ Unique factors affect the mental health of queer people, for better or for worse
- ▶ Social oppression vs. social connection
- ▶ Purpose: build a model to predict psychological well-being among queer people, and interpret the most influential factors.

# Terminology

LGB and Queer

Scales and Scores

# Terminology

## LGB and Queer

- ▶ Participants were
  - ▶ Cisgender, with a minority sexual orientation, OR
  - ▶ Not cisgender, but didn't identify as trans either
- ▶ I chose the term queer.

## Scales and Scores

# Terminology

## LGB and Queer

- ▶ Participants were
  - ▶ Cisgender, with a minority sexual orientation, OR
  - ▶ Not cisgender, but didn't identify as trans either
- ▶ I chose the term queer.

## Scales and Scores

- ▶ Participants answered nearly 200 questions (items).
- ▶ Many questions grouped together into scales.
- ▶ Participants received one score per scale.

# Method

- ▶ Dataset from Ilan H. Meyer
- ▶ 1518 observations from 2016
- ▶ Feature selection (1): elimination
- ▶ Feature engineering: condense, impute
- ▶ Feature selection: correlations, graphs
- ▶ Linear modeling for inference

# Example: Kessler-6 Inventory (Scale)

During the past 30 days, about how often did you feel...

- |   |                |
|---|----------------|
| A. Nervous                                      | 1. All         |
| B. Hopeless                                     | 2. Most        |
| C. Restless or fidgety                          | 3. Some        |
| D. So depressed that nothing could cheer you up | 4. A little    |
| E. That everything was an effort                | 5. None        |
| F. Worthless                                    | ...of the time |

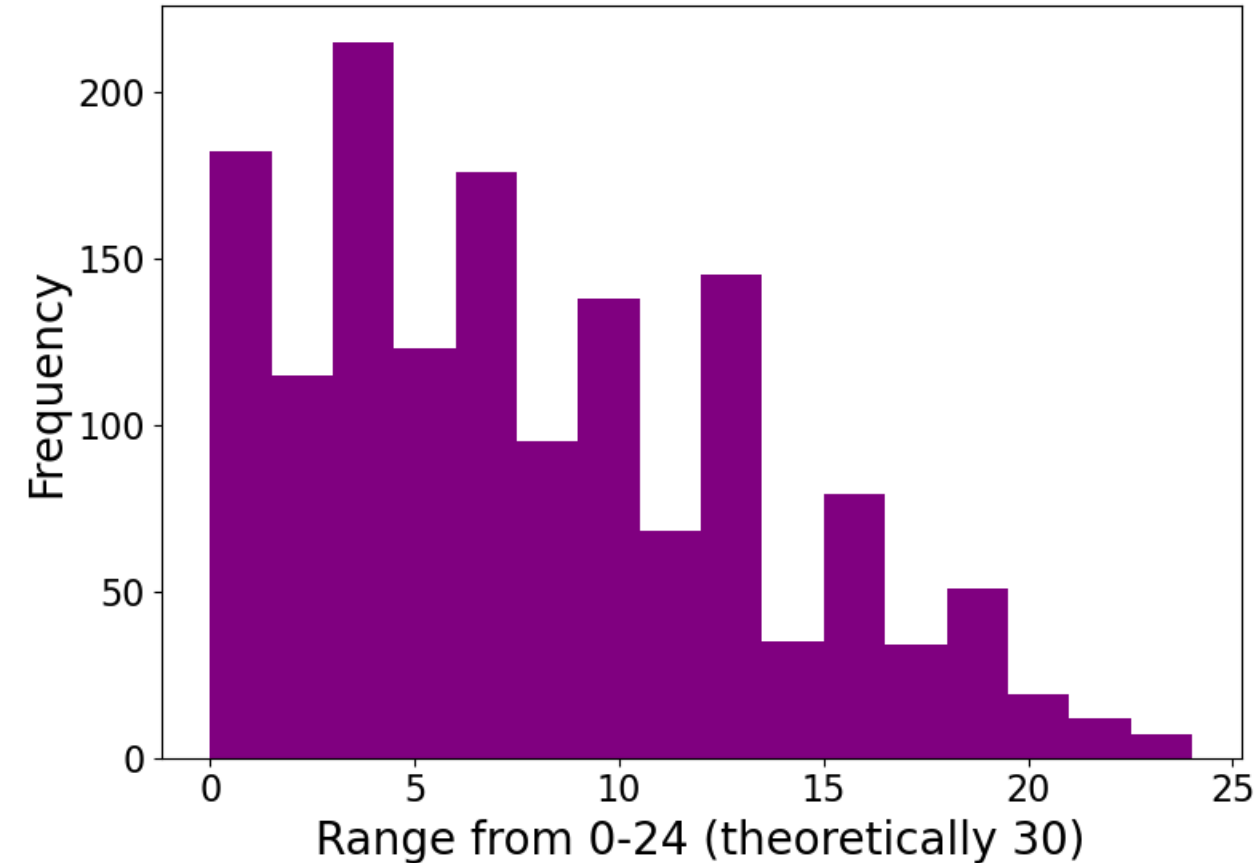

Distribution of Kessler Scores

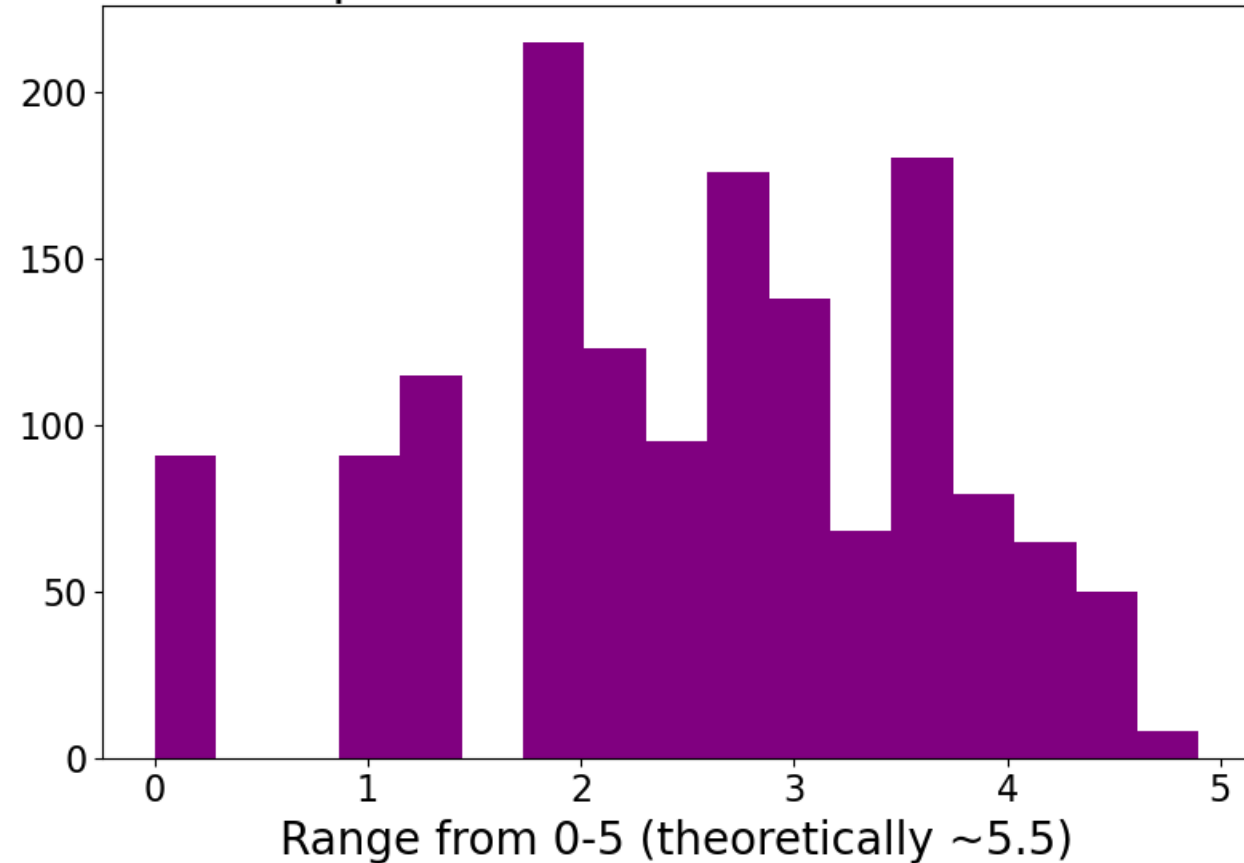

# Distribution Woes

Raw Kessler Scores

Square Root of Kessler Scores

# Distribution Woes

QQ-Plot of Kessler Scores

QQ-Plot of SQRT Kessler Scores

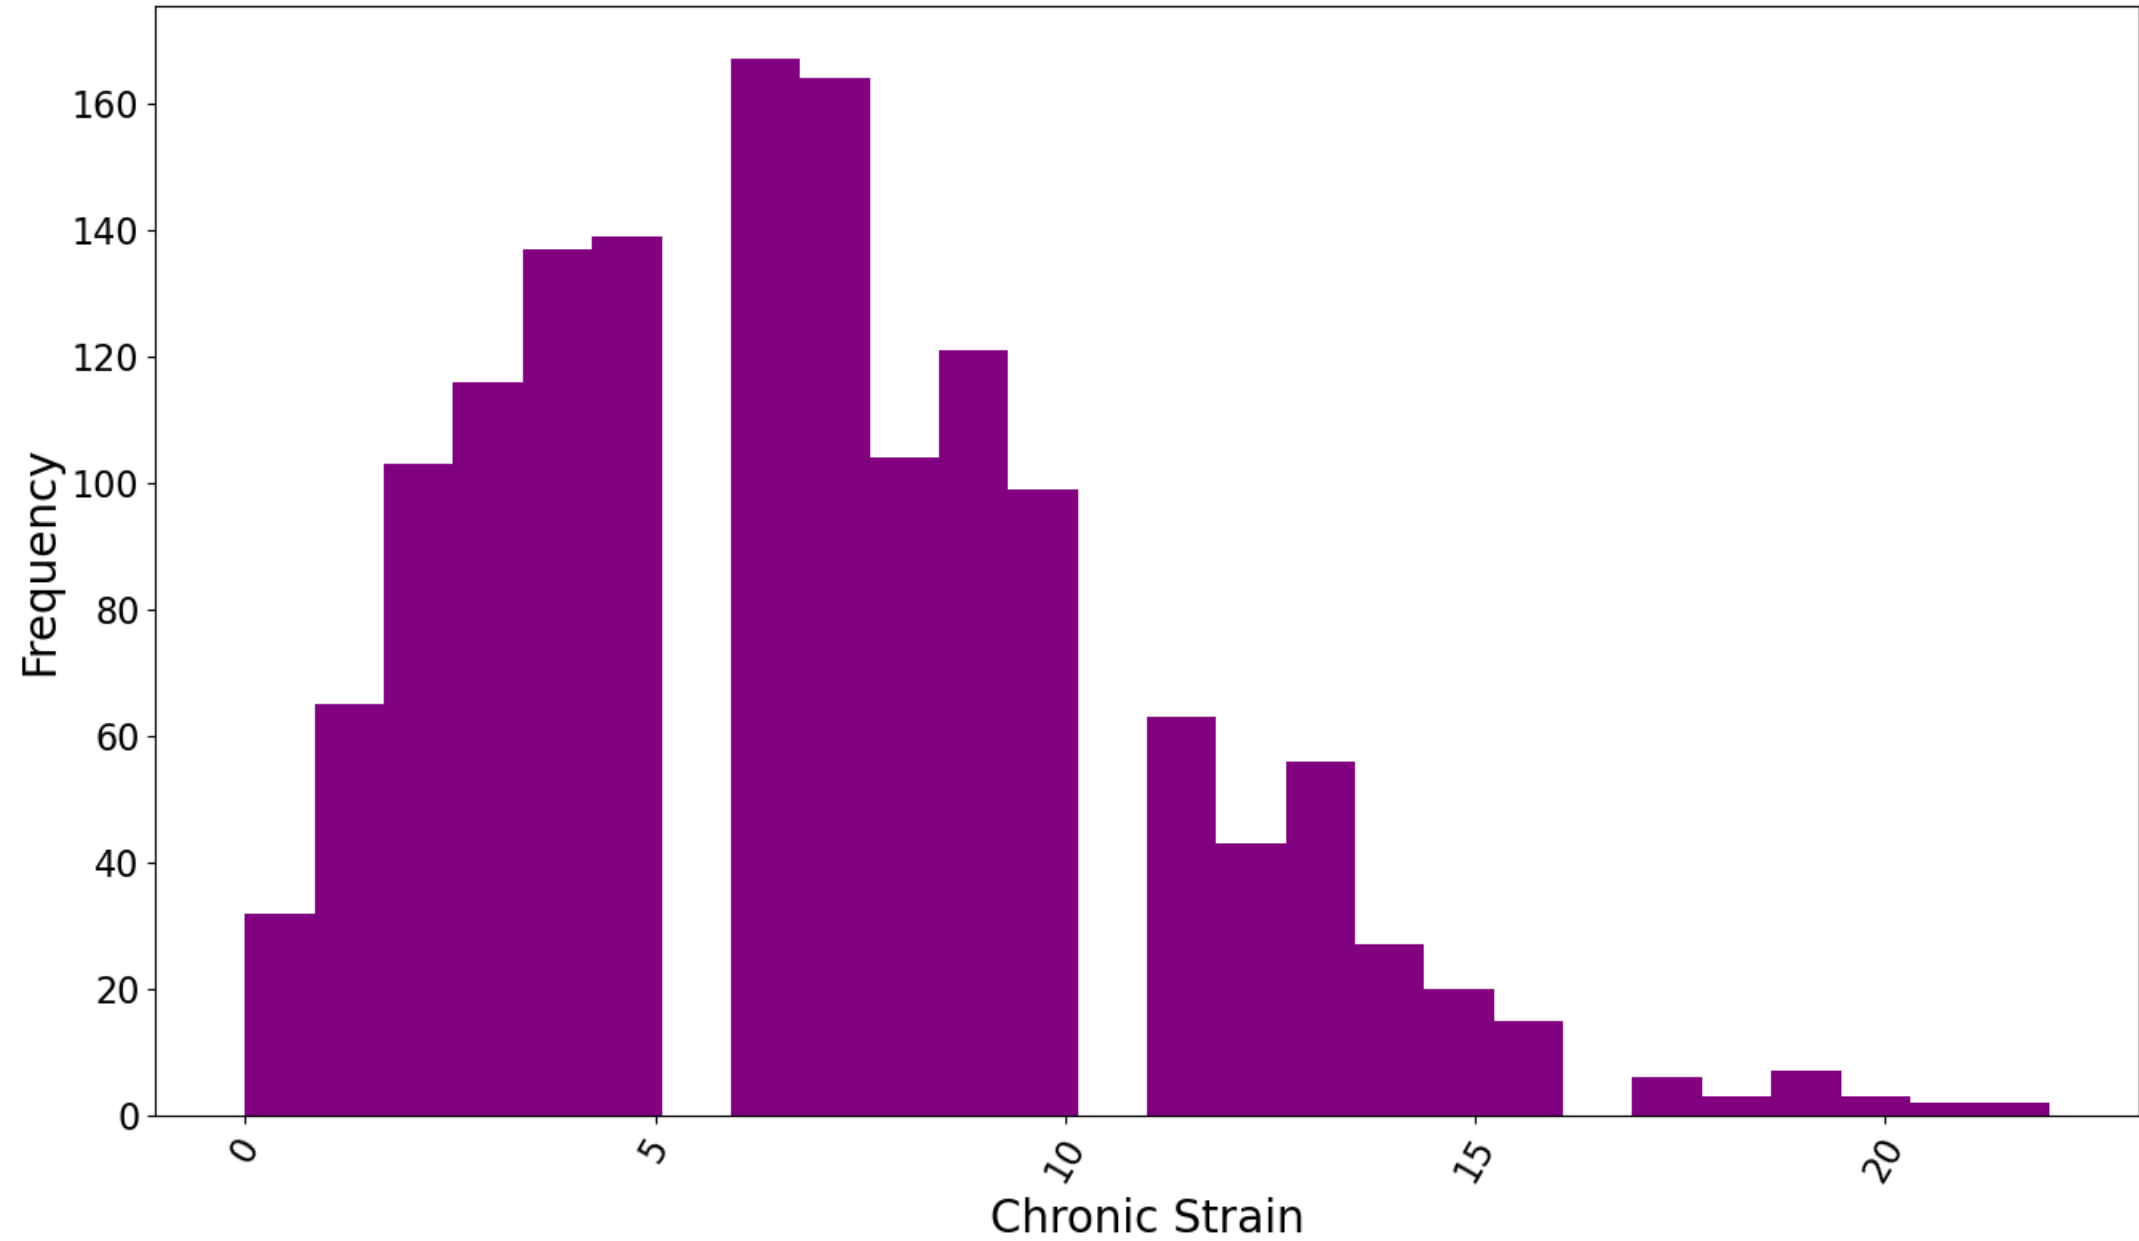

# Features

- ▶ Demographics
- ▶ Life stress
- ▶ Victimization and discrimination
- ▶ Adverse childhood experiences (ACE)
- ▶ Healthcare access, use, and outcomes (Kessler-6)
- ▶ Identity, community, outness (sexual orientation & race)
- ▶ Well-being acceptance, & social support
- ▶ Childhood GNC
- ▶ Felt stigma
- ▶ Internalized homophobia
- ▶ Conversion “therapy”

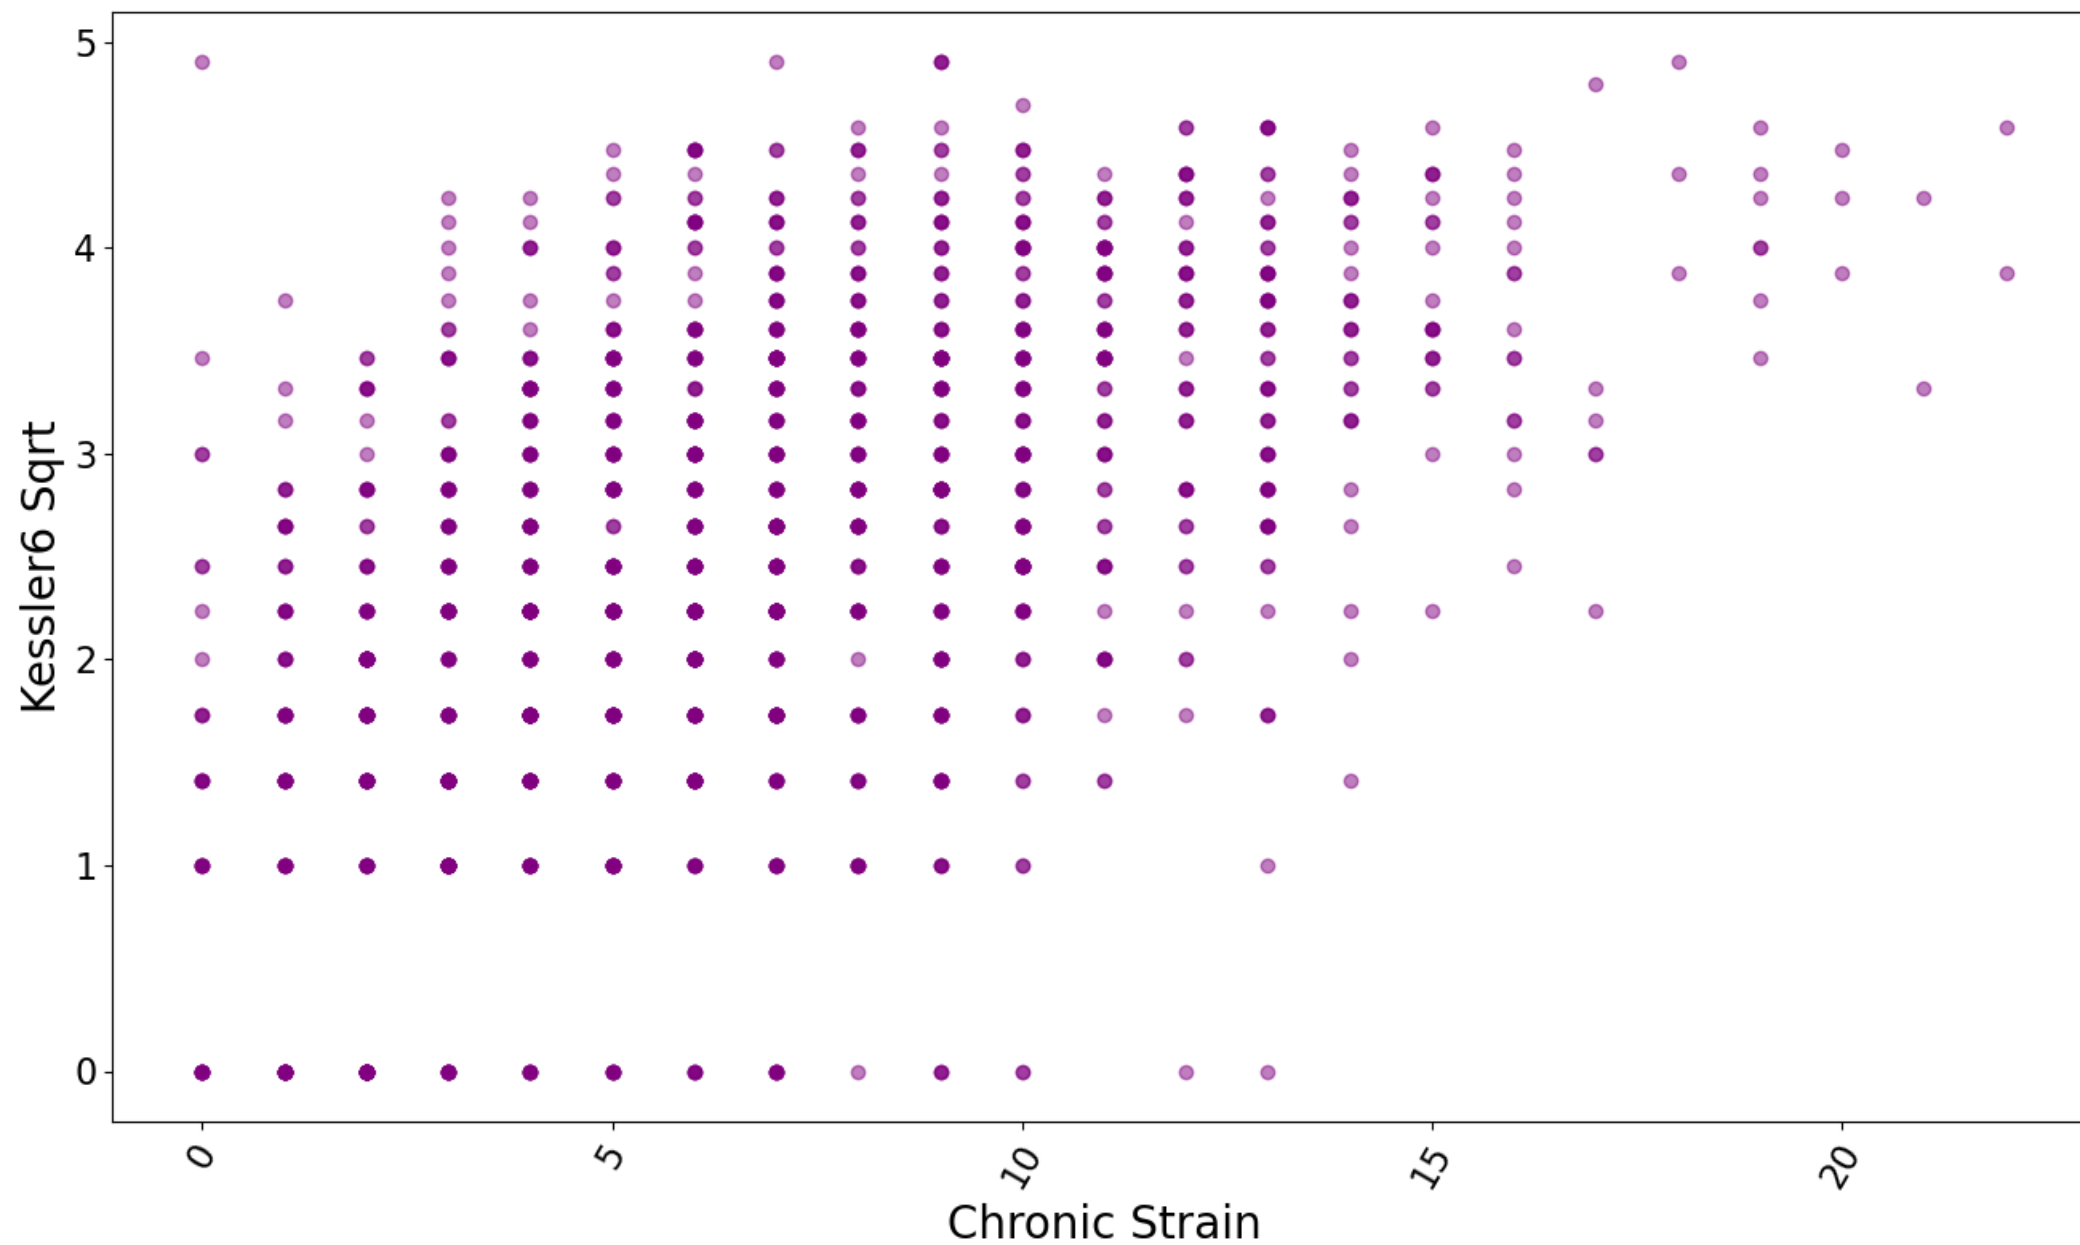

# Distribution of Chronic Strain

Based on 1494 Observations out of 1494

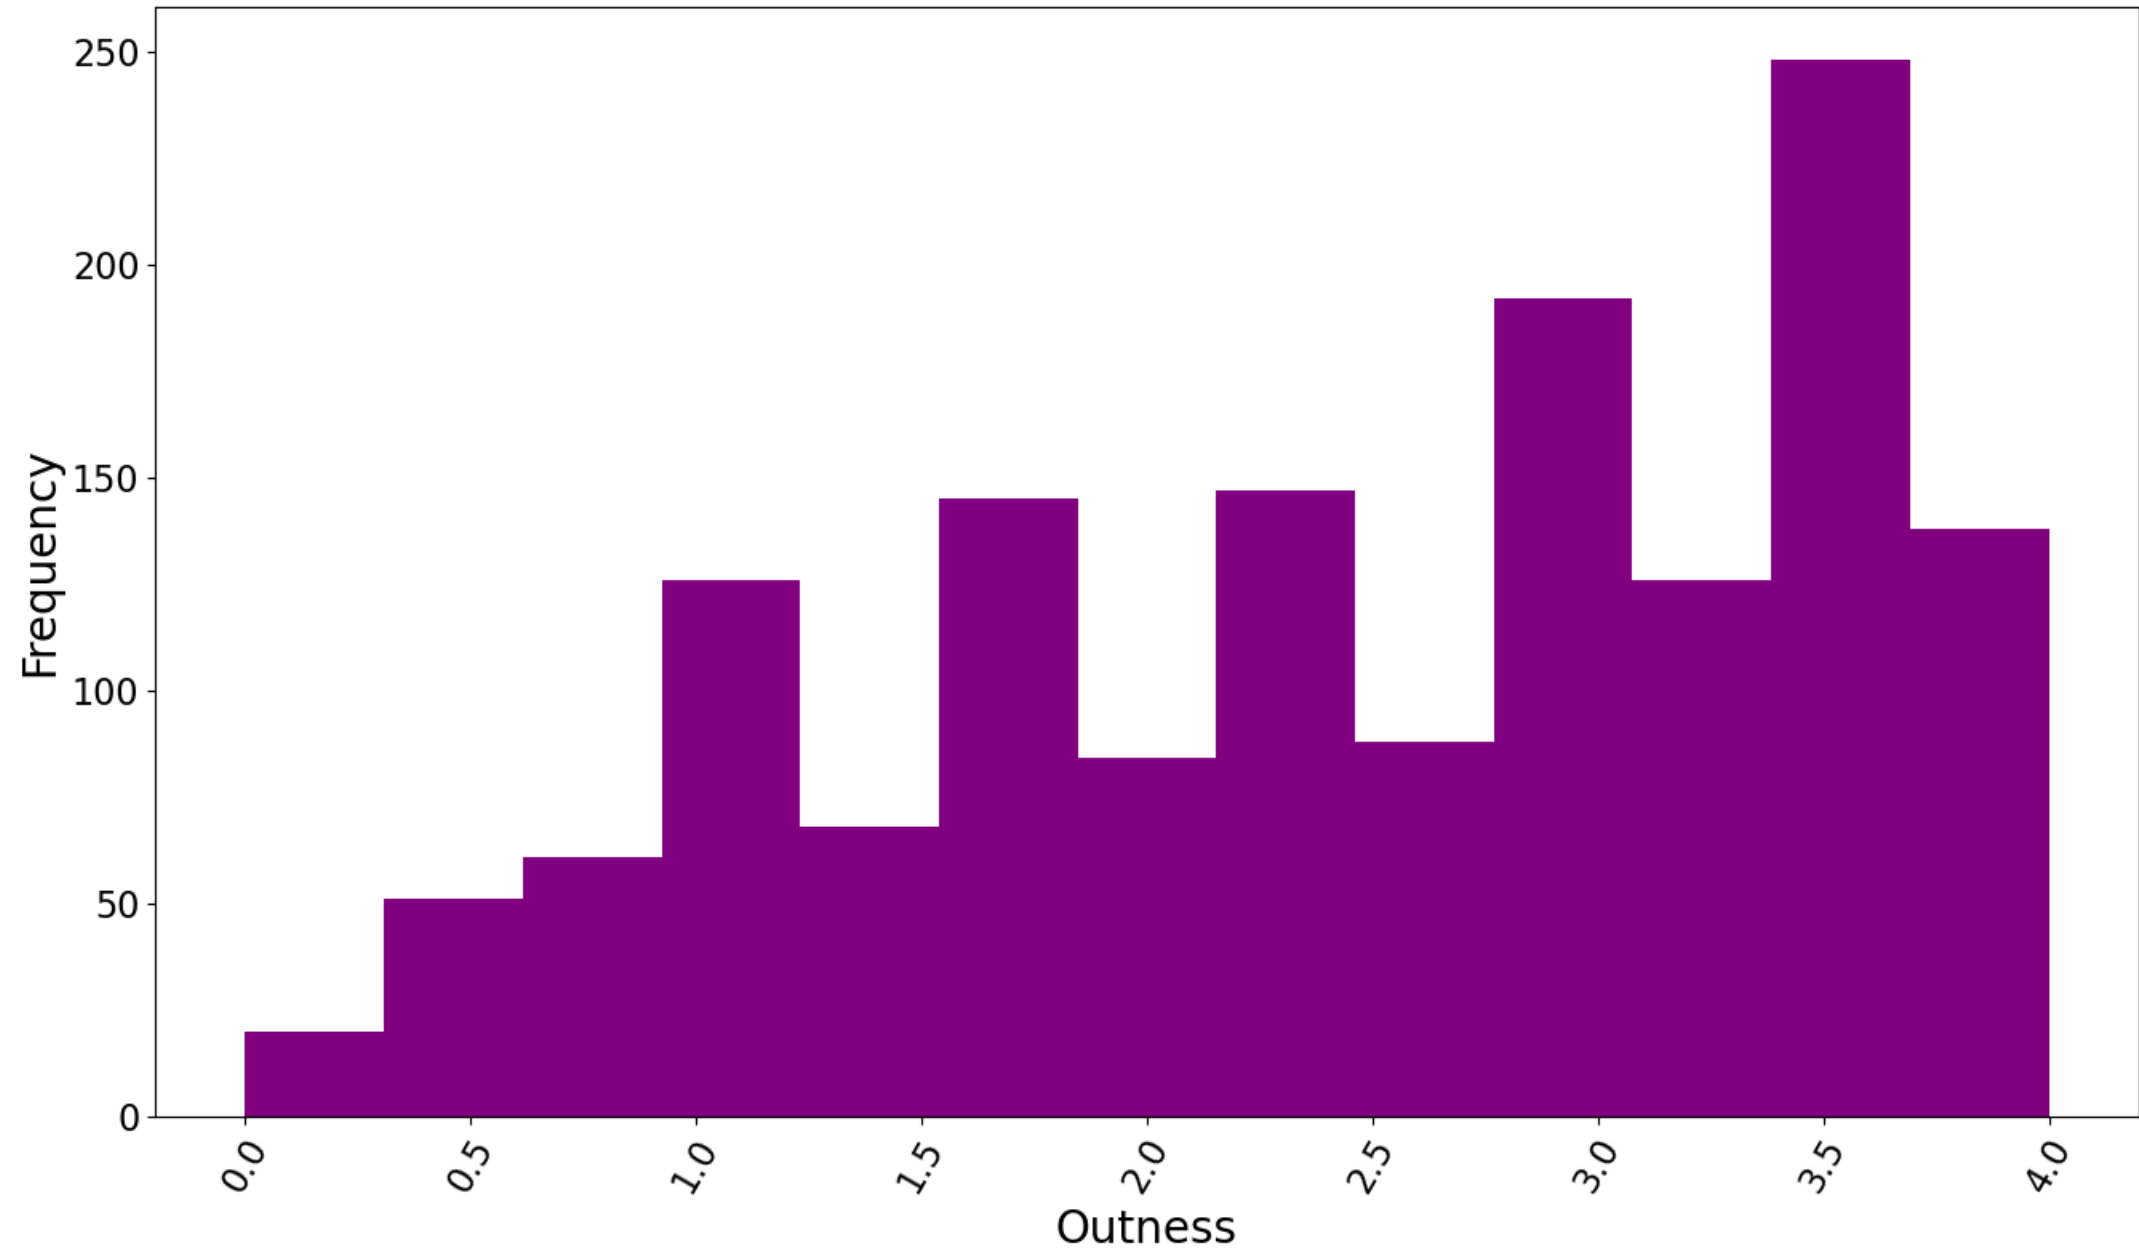

# Relationship between Chronic Strain and Kessler6 Sqrt

Based on 1494 Observations out of 1494

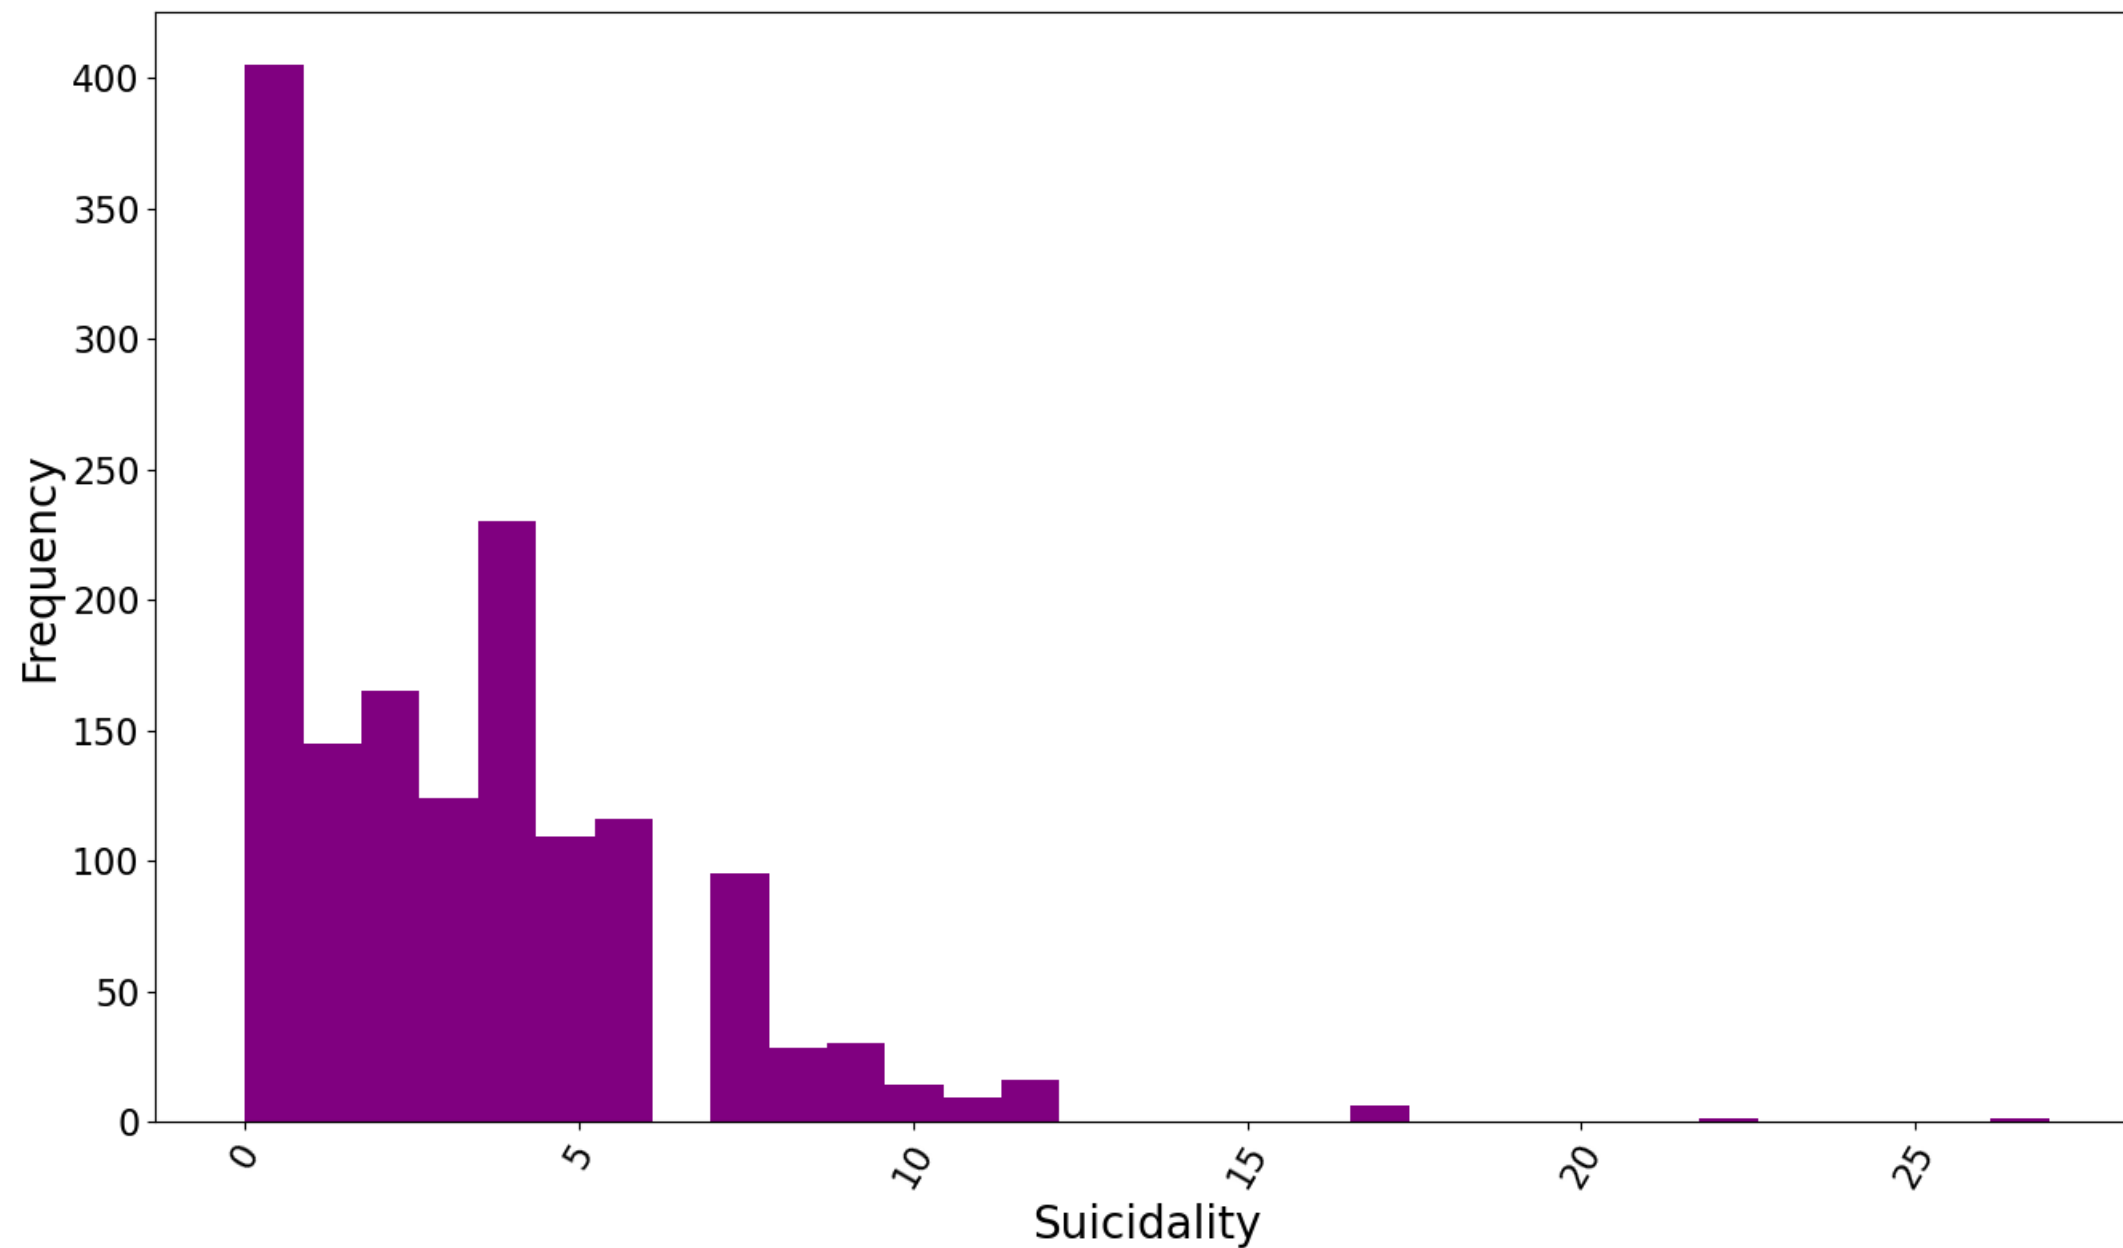

# Distribution of Outness

Based on 1494 Observations out of 1494

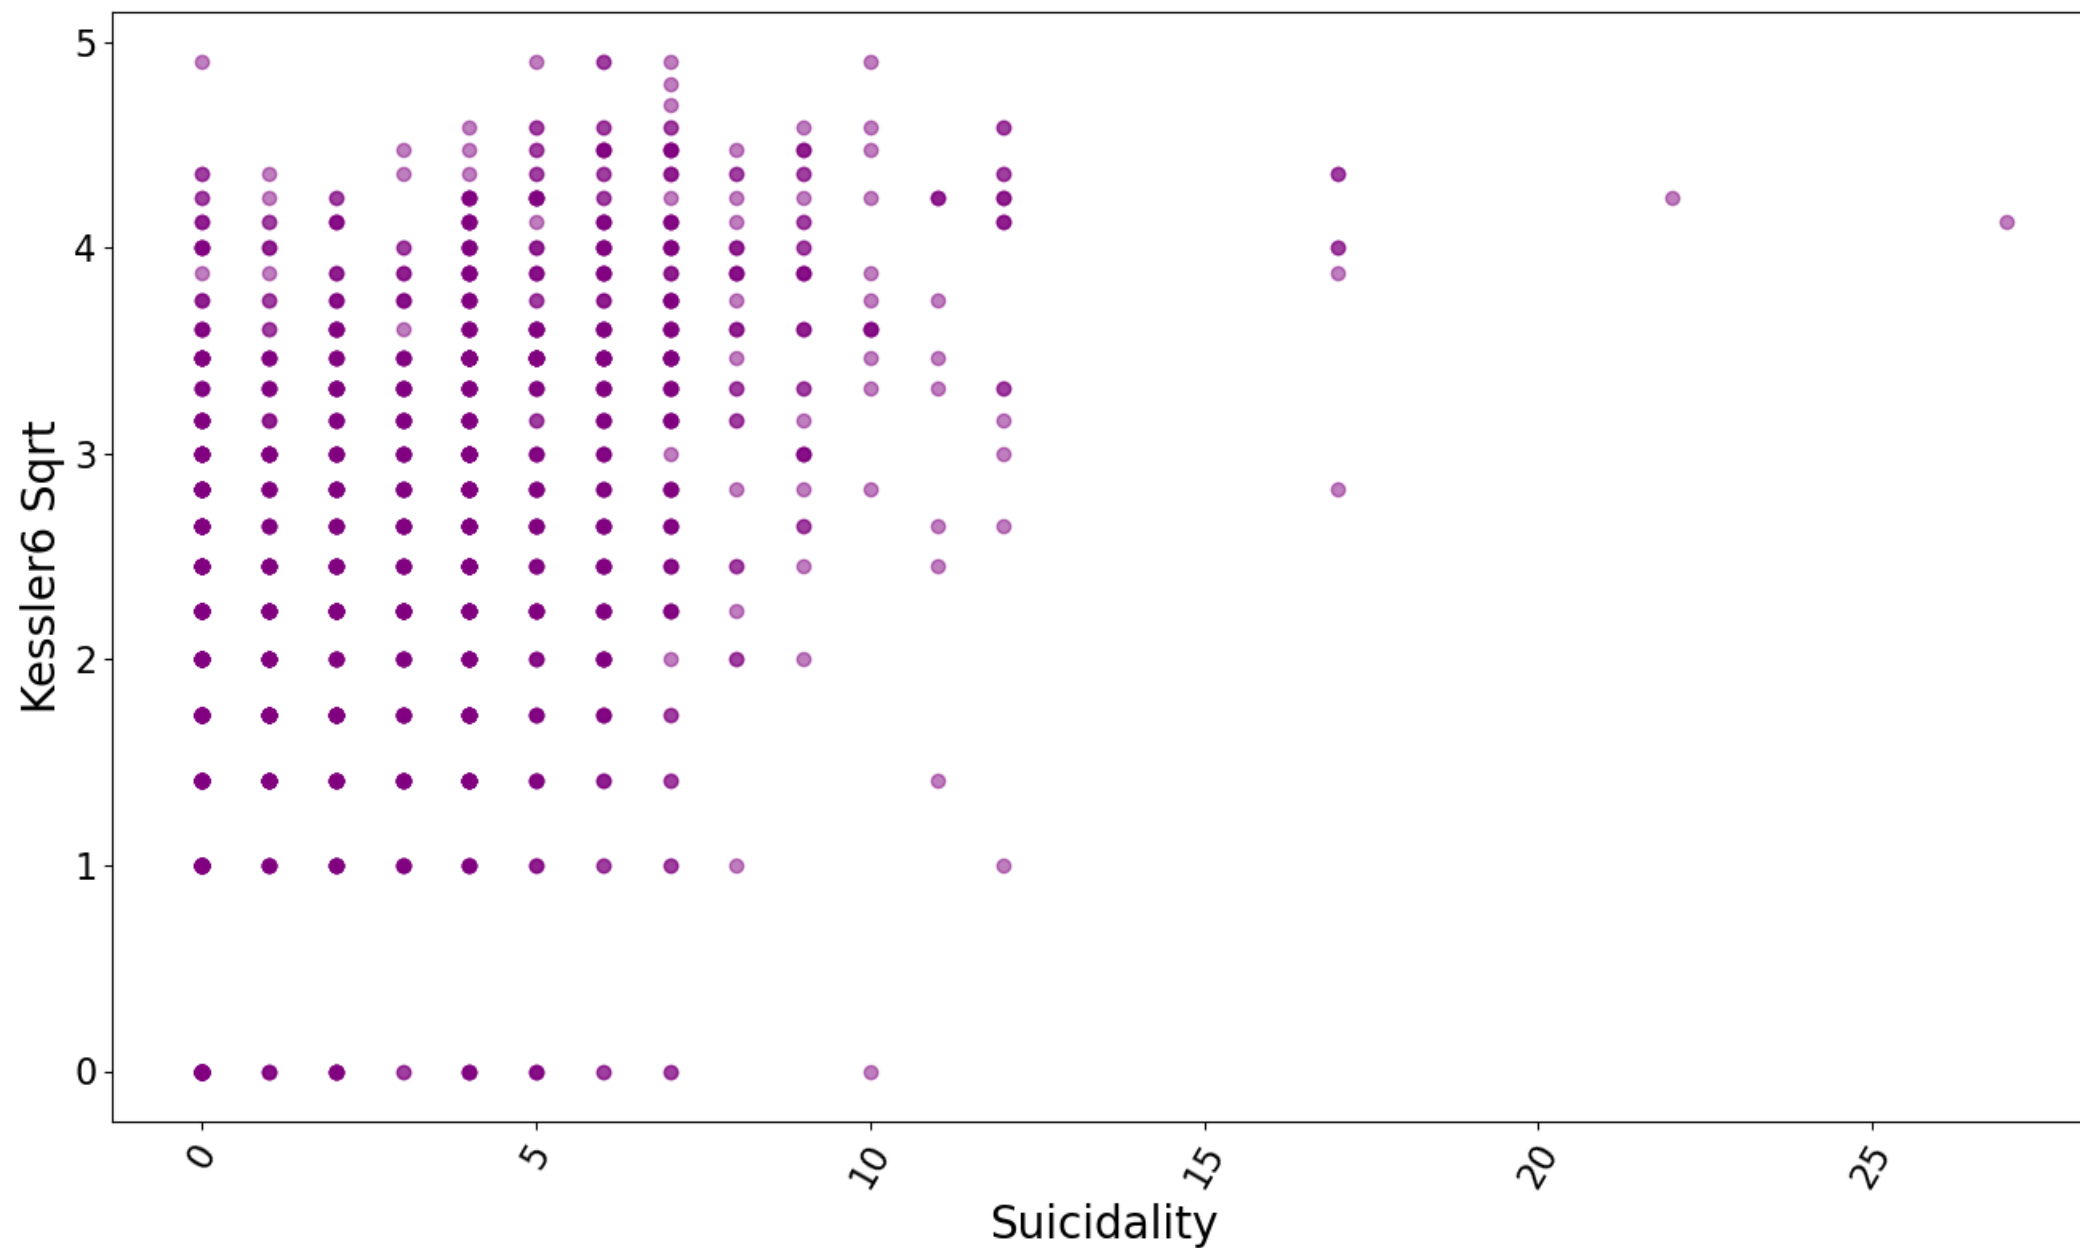

# Distribution of Suicidality

Based on 1494 Observations out of 1494

# Relationship between Suicidality and Kessler6 Sqrt

Based on 1494 Observations out of 1494

# Model

## Covariates

- ▶ Age
- ▶ Life satisfaction
- ▶ Income & poverty
- ▶ General happiness
- ▶ Mental health\*
- ▶ Born/raised in USA
- ▶ Being retired
- ▶ Religiosity

## General Predictors

- ▶ Chronic strain (stress)
- ▶ Racial ID centrality
- ▶ Suicidality
- ▶ Alcohol or drug (ab)use
- ▶ Everyday discrimination
- ▶ Denial of housing
- ▶ Social support/well-being
- ▶ Lifetime HIV or other STIs

## Queer Predictors

- ▶ Community connection
- ▶ Conversion “therapy”
- ▶ Felt stigma
- ▶ Sexual ID centrality
- ▶ Internalized homophobia
- ▶ Outness in school (as teen)
- ▶ Presence / length of romantic relationship

# Model Results

This model explained ~60% of the variance in SQRT Kessler scores.

# Model Results

## Predictions vs. SQRT Kessler

- ▶  $R^2$ : 0.59
- ▶ MSE: 0.42
- ▶ RMSE: 0.65
- ▶ MAE: 0.50

## Squared Predictions vs. Kessler

- ▶  $R^2$ : 0.59 (same)
- ▶ MSE: 9.70
- ▶ RMSE: 3.11
- ▶ MAE: 2.37

# Model Coefficients

## 5 Largest

- ▶ Routine discrimination (0.17)
- ▶ Social well-being (-0.10)
- ▶ General happiness (0.10)
- ▶ Raised in US (-0.09)
- ▶ Being retired (-0.07)

## 5 Smallest

- ▶ Length of relationship (0.003)
- ▶ Drug (ab)use (0.006)
- ▶ Alcohol (ab)use (0.007)
- ▶ Religiosity (-0.009)
- ▶ Outness as a teen (0.011)

## Of Interest

- ▶ Felt stigma (-0.01)
- ▶ Internalized homophobia (0.05)
- ▶ Community connection (0.04)
- ▶ Sexual ID centrality (0.03)
- ▶ Conversion “therapy” (0.03)

# Limitations

- ▶ The data is from 2016: pre-pandemic, early-Trump era
- ▶ Lots of imputation
- ▶ Limited time for feature selection and engineering
- ▶ Not all assumptions for linear modeling are met
- ▶ Cross-sectional survey data cannot establish causality

# Recommendations

## For society

- ▶ Stop discriminating!
- ▶ Personal well-being > relationship status
- ▶ Be better to immigrants and working people
- ▶ End the war on drugs

## For me

- ▶ Finesse these features
- ▶ Explore other features
- ▶ Stress-test the imputations
- ▶ Test other y variables
- ▶ Get newer data

# Conclusion

- ▶ I replicated the broad strokes of prior research, but...
- ▶ My first model has some odd results, likely due to colinearity.
- ▶ I want to keep trying to improve the model, generate more useful insights, and make the world better.

**Thank you, and  
happy pride month!**

**I will now take questions.**
